Creating a Distributed File System (DFS)

While working in this project I learned a lot about working in groups. Although I have worked in various projects with different teams this experience was different. This was the first time I was in a group in which one of the team members did not go once to a meeting. Also this was the first time I had to deal with a team member that did not know anything about python or git but still wanted to help and be useful. My difficulty in this project was to help my teammate help me. Some of the more difficult aspects of this assignment included figuring out how to implement the proper functions to allow our system to handle huge amounts data. Most of these problems were resolved by searching the internet for references and discussing the components of a file system with: Christian Rodriguez, Rafael Esparra. I believe this project would be rated a 5 on a scale of 10, in terms of coding difficulty and 10 of 10 in terms of team leading. Overall I think this project was a good experience because I learned lot about working in teams.
